

AutoInstall SSL™

cPanel Settings Guide

AutoInstall SSL™ 2.0 Settings for cPanel

1. Now, we have added "apisettings.xml" file in Installation so that server administrator/reseller can test AutoInstallSSL Certificate in test mode. Following are steps to make changes in file to change mode.

→ Login to server using Putty

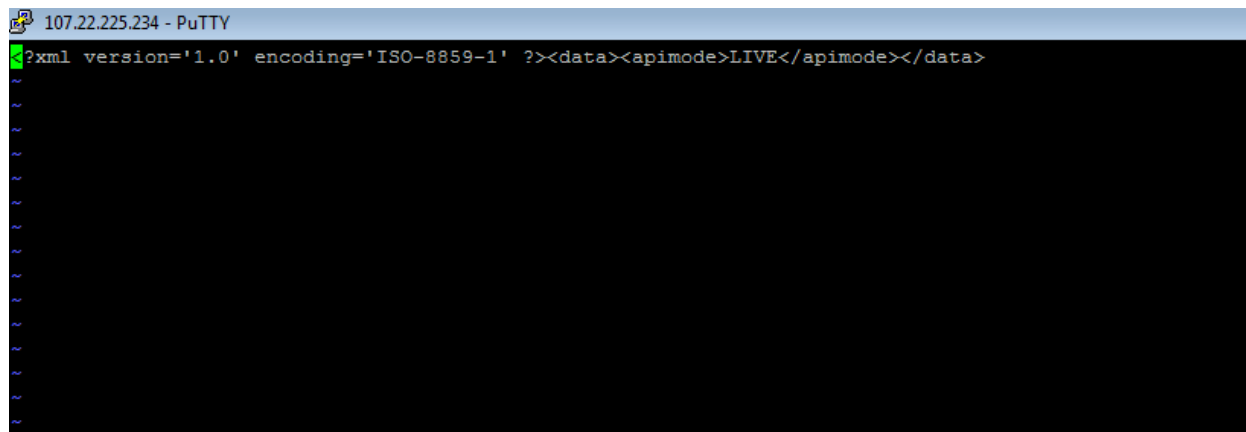

→ If you are using "vi" or nano editor type following command

```
vi /usr/local/cpanel/base/frontend/theme/autoinstallssl/apisettings.xml
```

OR

```
nano /usr/local/cpanel/base/frontend/theme/autoinstallssl/apisettings.xml
```

Please replace **theme** with the theme name that you are using. It can be **x3** or **paper_lantern**.

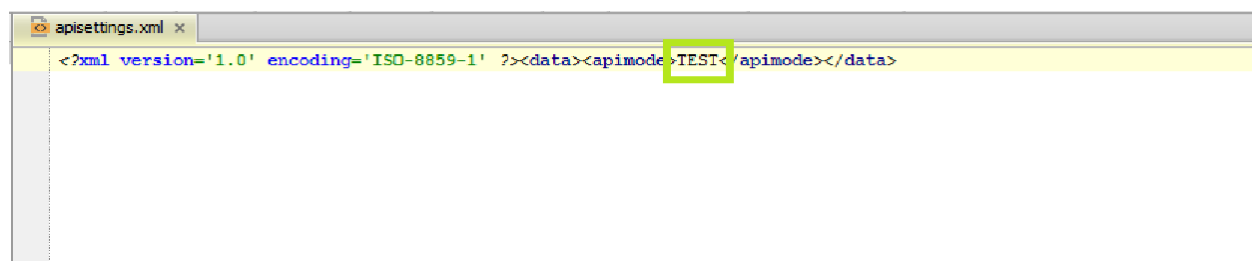

```
107.22.225.234 - PuTTY
<?xml version='1.0' encoding='ISO-8859-1' ?><data><apimode>LIVE</apimode></data>
```

There is alternative way too. You can use WinSCP to login to server and edit "apisettings.xml" at following location:

```
/usr/local/cpanel/base/frontend/theme/autoinstallssl/
```

Please replace **theme** with the theme name that you are using. It can be **x3** or **paper_lantern**.

```
apisettings.xml
<?xml version='1.0' encoding='ISO-8859-1' ?><data><apimode>TEST</apimode></data>
```

Note: In sandbox environment only few DV products can activated successfully. Also there are lots of chances of failed security review for products like rapidssl. So in sandbox environment Reseller won't be able to test all the products successfully.

2. If you have set the API mode to TEST than the message "TEST MODE" will display on the UI

Quick & Easy SSL Installation

Simply, copy & paste your Token Code and Token ID numbers in the corresponding fields below. You should have received these codes via email after your SSL purchase. After your tokens are verified, you'll be able to input the details for your CSR and Admin & Technical contacts. If you did NOT receive your Token Code & ID, please contact your provider.

AutoInstall SSL™ Multi-Language Support

Now, cPanel AutoInstall SSL support multi-language.

1. How to change cPanel language?

Please read this docs: <https://documentation.cpanel.net/display/68Docs/Change+Language>

2. How to add new language file for cPanel AutoInstallSSL module?

Currently, AutoInstall SSL™ is came with english(en.php) language. Follow below steps to add new language file.

- ➔ Create new language file at: /usr/local/cpanel/base/frontend/<theme_name>/autoinstallssl/resources/locales/.
- ➔ Copy content from "en.php" and paste into created language file.
- ➔ Now, you can change the value of key that you want to translate in newly created language file.
